Low-power current transformers with voltage output

Unlike conventional current transformers with 1 or 5 A, secondary output signal give to current sensors an output voltage signal.

Figure 1: Principle of the low-power current transformer

As can be seen in the illustration, a conventional current transformer is loaded with a measuring resistor in the housing. In most cases, the resistor value is between 0.5 and 5 ohms and converts the current signal into a voltage signal. According to international standardisation, 22.5 mV, 150 mV and 225 mV are specified for the output voltage. In addition to these values, the value 333 mV has also become established on the market.

Low-power transformers are currently not approved for offsetting measurements, so they are usually connected to universal measuring devices with voltage input channels. The impedance of these input channels can be described as high-impedance and is usually well above 10 kOhm, so that only a very small proportion of the secondary current I_{sr} flows through the resistance of the measuring device. The measuring accuracy of the current sensor is therefore not significantly influenced by the measuring device and the supply line. An exact burden determination as with conventional current transformers can be omitted. Over- or under-burdening is ruled out. At the same time, dangerous open-circuit voltages are no longer possible due to the low-resistance loading in the transformer housing at the secondary terminals.

The primary and secondary connections are also labelled as for current transformers.

Figure 2: Terminal designations of the low-power current transformers

As with current transformers, these are passive transformers that do not require an additional power supply. The general normative requirements for these devices are currently defined in the following international standard:

IEC 61869-10: Instrument transformers - Additional requirements for low-power current transformers

The accuracy classes are defined similarly to the familiar current transformer classes. The following diagram shows the percentage amplitude errors of the accuracy classes up to class 1.

Figure 3: Accuracy classes for low-power current transformers

As the sensors are often connected to universal measuring devices that have a larger analogue bandwidth than meters, MBS low-power current transformers generally meet the requirements of class WB1 in accordance with IEC 61869-1. Here, a defined accuracy is defined as follows depending on the accuracy class up to 3 kHz.

Figure 4: Amplitude and phase errors of frequency class WB1

Current transformers – Technical Characteristics

Current transformers are special transformers for the proportional transformation of currents of larger current forces into direct measurable smaller values. Due to their constructive design as well as their physical operating principle a true galvanic separation between primary circuit and measuring circuit is achieved.

Primary rated current	Value of the primary current which marks the current transformer and for which it is rated.
Secondary rated current	Value of the secondary current which marks the current transformer and for which it is rated.
Rated Power	Value of the apparent power (in a VA) specified power factor which the current transformer is intended to supply to the secondary circuit at the secondary rated current and rated burden.
Measuring ratio	Ratio of the primary rated current to the secondary rated current. The actual measuring ratio of a current transformer is specified as an unbridged break.
Burden	Impedance of the secondary circuit expressed in Ohm with data of the power factor.
Rated burden	Value of the burden upon which the accurate requirements of the current transformer are based.
Rated frequency	Value of the frequency upon which the calculation of the current transformer is dependent.
Accuracy class	Declaration of a current transformer that its measuring deviation are governed within specified rules.
Phase displacement error [δ]	Phase shift difference between the primary and secondary current. The direction of the indicator is such that with an ideal current transformer the phase displacement is equal to zero.
Current deviation	Measurement deviation which a current transformer causes, when measuring a current, and the result hereby created, that the actual ratio deviates from the rated measuring ratio. The current error expressed in percentage is calculated according to the following rule:

$$F_i [\%] = \frac{(K_n I_s - I_p) \times 100}{I_p}$$

F_i = current error deviation in %
 K_n = nominal transformation ratio
 I_p = actual primary current
 I_s = actual secondary current if I_p low under measurement conditions

Maximum voltage for electrical equipment U_m	Effective value of the max. phase-phase-voltage for which a current transformer is measured, with a view of its isolation.
--	--

Total measuring deviation

In the stationary position the effective value of the difference between:

- The momentary value of the primary current and
- The momentary values of the rated measuring ratio multiplied by the actual secondary current whereby the positive symptoms of the primary and secondary currents correspond to the reconciliation for the connection denotation

The total deviation F_g is generally calculated in percentage of the effective value of the primary current as follows F_g :

$$F_g = \frac{100}{I_p} \times \sqrt{\frac{1}{T} \times \int_0^T (K_n i_s - i_p)^2 dt}$$

K_n = Rated measuring ratio

I_p = Effective value of the primary current

i_p = Momentary value of the primary current

i_s = Momentary value of the secondary current

T = Period duration

Rated-/current limit [I_{pl}]

Value of the lowest primary current whereby the secondary rated burden of the total deviation of the current transformer is equal or larger than 10 %.

Over current-/limit factor (FS)

Ratio of the limited current to the primary rated current.

Thermal nominal rated continuous current [I_{cth}]

Value of the current in the primary winding, the excess temperature adhere to the norm value and the secondary winding is loaded with the rated burden.

Thermal rated short time current [I_{th}]

Effective value of the primary current which the current transformer can hold for 1 second w/o damage with short circuited secondary winding.

Rated surge current [I_{dyn}]

Peak value of the primary current, whose electro-mechanical impact is resisted by the current transformer with short circuited secondary winding without electrical and mechanical damage.

“Open circuit voltage” of current transformers

Current transformers which are not switched directly to a consumer have to be secondarily short circuited to conform with safety standards.

A secondary open operated current transformer induces on its secondary terminals very high peak voltages. The combined amounts of these voltages can reach values of some kilovolt and, dependent on the dimension of the current transformer, result a hazard for people and prevent the continuous trouble free operation of the transformer. For safety reasons and to eliminate the iron core being magnetized in a secondary operated open operation, an open operation should be discouraged.

Earthing of secondary terminals

According to DIN VDE 0141 (01/2000) paragraph 5.3.4, the current- and voltage transformers for rated voltages from $U_m = 3.6$ kV are to be secondarily earthed. At low voltage ($U_m \leq 1.2$ kV) earthing is not required as long as the transformer housings are compact and do not have exposed metal surface.

Primary bus bar cross sections

The geometric dimension of the primary conductor aperture of our current transformers are only limited for the actual interpretation of the nominal current range. In the range of the primary conductor, the total bus bar cross section of the current transformer can be calculated fractually smaller, provided it is ensured that the excess temperature is absorbed via the connection cross section of the bordering bus bar.

Special configurations

- Saturation current transformers on request
- Current transformers for tropical application on request
- Primary nominal currents deviating from preferred values on request
- Deviating rated frequencies
($16^{2/3}$ up to 400 Hz) on request
- Transformers for higher mechanical load capacity
(vibration protection) on request

Design of MBS low-voltage current transformers

The current transformers have the following characteristics:

- Break-proof plastic casing
- Black polycarbonate
- Low flammability
- Self-extinguishing
- Ultrasonically welded transformer casing
- Nickel-plated secondary terminals with nickel-plated plus/minus screw M 5 x 8 mm
- Integrated secondary cover flap
- Connection cross section: max. 4 mm² with ferrule, 6 mm² solid.

Foot angle and rail fastening screws with protective insulating cap (contact protection) are included in the scope of delivery. All transformers are suitable both for use on solid primary conductors and on flexible, insulated copper strip.

Isolation protection cap

Bus bar mounting screw,
screw length (L) 25, 32, 36, 46, 54,
80 mm, torque 0,5 Nm

General technical information:

Rated frequency	50(60)Hz (16 2/3 up to 400 Hz upon request)
Maximum voltage for electrical equipment	U_m % 0,72 kV
Isolation class	E
Isolation testing voltage	3 kV, 1 min, U_{eff} , 50 Hz (U_m % 0,72 kV) 6 kV, 1 min, U_{eff} , 50 Hz (U_m % 1,2 kV)
Thermal nominal continuous rated current	$I_{cth} = 1,0 \times I_n$ (higher values upon request) $I_{cth} = 1,2 \times I_n$ (KSB, KSK 165.5, KSK 205.5)
Thermal rated short time current	$I_{th} = 5 \times I_n$, 5sek (max. 100 kA) (Types KSR, KSK, KSW, KBU, KBR, KSKSU)
Ratio surge current	$I_{dyn} = 2,0 \times I_{th}$
Over current-/limit factor	FS 5 to FS 15 (exact specification, on the name plate)
Working temperature range	$-5^\circ\text{C} \leq \vartheta \leq +50^\circ\text{C}$
Storage temperature range	$-25^\circ\text{C} \leq \vartheta \leq +70^\circ\text{C}$
Applied norms	DIN EN 61869/1 DIN EN 61869-6 DIN EN 61869-10

Operating instructions

The installation of current transformers and the locked measuring appliance is only allowed if the unit is without voltage! The wiring of the current transformers follows under using the following junction diagrams.

While using the current transformer with opened secondary circuit there may be dangerous voltages for man at the secondary connections. An opened using of the secondary circuit of current transformers is therefore not allowed! Before an exchange of measure appliance in the secondary circuit of the current transformer there must be a short-circuit on his secondary connections.

The above values apply to continuous current load at approx. 30 °C ambient temperature.

Designations of the current transformers' connection terminals

The connections of all primary windings are marked with capital letters „P₁“ and „P₂“, the connections of all secondary windings are marked with the corresponding lower case letters „s₁“ and „s₂“.

By current transformers with a multiple secondary windings the winding end is marked „I“ followed by the prefix „I₁“, the windings with a decreasing number of windings are sequentially numbered to „2“; „3“ etc.

By summation current transformers with a multiple of independent primary windings, the terminals of the individual windings are distinguishable from the terminal details „K“ or „L“ set before the capital letters „A“, „B“, „C“.

By summation current transformers which are for the connection of different main transformers, the connection of the main transformer with the highest ratio transmission is made to the lowest terminal pair („AK“-„AL“). The correct order of connection can also be seen from the name plate which bears an information of the individual nominal currents.

Example:

Main current transformer 1: 300/5A

Main current transformer 2: 150/5A

Main current transformer 3: 100/5A

-> Information on the name plate: **6_A : 3_B : 2_C**

Power requirements of measuring devices and relays

By application of current transformers, two main demands will be requested from the user:

- high degree of measuring precision in the nominal current range
- protection function in the over current range

In order to fulfill these demands it is necessary that the assumed nominal power of a current transformer is adapted to the actual power requirements of the measuring conductor. When establishing the actual power requirement, consideration has to be given not only to power losses of units to be connected, but also to the losses of the measuring conductors.

For the realization of the demands it is necessary that the assumed nominal power of the current transformer is largely adapted to the actual power requirements of the measuring set up. For the appraisal of the actual power requirements, apart of the own power consumption requirements of the connected measuring units, also the conductor losses must be considered which are connected to the secondary circuit of the transformer measuring conductors.

Own Power consumption requirement of typical measuring units

Current meter soft iron up to 100 mm Ø	0,700	–	1,5 VA

Wound current transformers

Based on the physical operating principle of current transformers, the required core volume transferring an amount of power, increases rapidly with a decreasing nominal current. As there are limits on increasing the transformer size, wound current transformers are being used.

Interim current transformers also belong to the group of wound current transformers. This construction is mainly used for primary currents of up to 10 A, and achieves a transformation at a higher or lower secondary current values. In addition to their application in adapting a measuring circuit on existing measuring units, interim current transformers are being used also for lowering the power loss by the transmission of analogically measured values over great distances. This is made possible by means of a squared dependence of the power loss from the flowing current.

$$P_v \text{ [W]} = I_s^2 \times R_L$$

Specified therein: P_v Power loss in Watt
 I_s Secondary nominal current of the current transformer in Ampere
 R_L Lead resistance of the secondary connection cables in Ohm
(Important: Lead resistance of the flow- and return conductor!)

This means when the original nominal current is halved, the conductor loss drops down to 25 % of its original value.

Note: Since an intermediate current transformer in the secondary circuit of a main transformer represents an additional inductive load, its own power requirement must be taken into account when selecting the correct main transformer.

For the correct power rating of the main transformer to be used, please use the following formula below:

$$P_{GH} \text{ [VA]} = P_z \times \left(\frac{I_2}{I_1} \right)^2 + P_E + P_E$$

Legende: P_{GH} Apparent power of the main transformer
 P_z Secondary performance of the interim transformer
(nominal performance inclusive of conductor losses)
 P_E Consumption of the interim transformer by nominal current
(typical: approx. 3 VA)
 P_{HZ} Conductor losses between main- and interim transformer by nominal current
 I_1 Primary nominal current of the interim transformer
 I_2 Secondary nominal current of the interim transformer

250	0...333	18-1031

- Split-core current transformers are mainly used for an easy fitment and subsequent assembly into an already existing installation, without separating the primary conductor.
- The compact split-core current transformer KBR 18 has been developed to have easy access in already existing installations.
- Due to the „click“-system and the fixing-clasps even a one-hand mounting is possible.
- The delivery follows with 2.5 m connection cable 2 x 0.75 mm² (color coded; S1 = brown; S2 = blue), other lengths of the connection cables are possible on request.
- For the use as a current sensor the KBR 18 is optionally deliverable with a voltage output of 0 – 333 mV (Min. burden resistance ≥ 1 kΩ).
- Operating temperature: -5°C < T < +50°C
- Storage temperature: -25°C < T < +70°C

Other output signals like 22.5 mV, 150 mV, 225 mV on demand.

KBR 32 / 44

Technical characteristics for the KBR with output signal 4...20 mA:

- 2-wire connection, auxiliary power via output circuit
- Auxiliary power: 24 V DC $\pm$ 15 %, P_v = max. 1 VA
- Load-independent DC current: Live-zero, 4...20 mA
- External resistance: max. 300 Ω
- Current limit under overload: < 30 mA
- Residual ripple of the output current: $\leq$ 1 % p.p.
- Response time: < 300 ms

Wiring diagram of the KBR 32 / 44 (4...20 mA):

Low-voltage current transformers for industrial applications

Summation current transformer

KSKSU

Inputs: 2 ... 3

KSSUSK

Inputs: 3 ... 8
Transformer width: 156 mm

Current range: 1 A or 5 A

Page: 81

Guidance when ordering summation current transformers

Summation current transformers are suitable for the summation of several synchronized alternating currents with similar phases but with differing load phase shifts. It is also possible to have the summation of currents with varied nominal voltages of similar phase positions. These measurements cannot be used for tariff applications, as the existing voltage differences are recorded as errors.

With the counter connection of the main transformer to the summation current transformer, it is possible to receive secondary currents which are proportional to the differences of the primary input currents.

The built-in technical know-how enables the summation current transformers to add secondary currents of varying nominal transmissions from the main transformer.

The secondary connections of each main transformer are connected to the allocated primary inputs of the summation current transformers.

The number of windings of individual partially wound primary circuits of the summation current transformer is proportionally aligned to the ratio of the primary nominal current of the corresponding main transformer, and to the sum of the nominal currents of all the summation current transformers being connected to the main transformer.

For the visual display of the current, a measuring unit can be used with a measuring range similar to the secondary nominal current of the summation current transformers.

It is irrelevant for the main transformers with similar nominal transmission ratios, to which primary circuit of the summation current transformer the connection is made.

With main transformers of different nominal transmission ratios, care must be taken to adhere to the assigned connection to the terminals of the summation current transformers.

If the current flow in the main transformer is interrupted, the secondary circuit of the main transformer must neither be short-circuited nor be connected to the summation current transformer, or to the main transformer.

Summation current transformers with unallocated primary circuits must remain open for a later connection to an additional main transformer. The secondary output current of the summation current transformer is in this instance lower than the secondary nominal current of the summation current transformer by a quantity equal to the ratio of the primary nominal current of this "missing" main transformer and the sum of all the primary nominal currents of the main transformer.

The nominal secondary current of a main transformer must be equal to the nominal primary current of the input allocation of the summation current transformer.

Guidance when ordering summation current transformers

Please find below an example for the correct selection of measuring components for summation current transformers.

Example:

Actual situation:	3 transmission ratios	1000 / 5 A 800 / 5 A <u>600 / 5 A</u> 2400 / 5 A
	Overall current	
Consumers:	– 1 current meter – 1 power recorder	
Looking for:	1 summation current transformer and the VA power of an individual main transformer	
Required active performance of the summation current transformer:		

Current meter	1.5 VA
Power recorder	7.0 VA
Measurement conductor loss	1.5 VA
Consumption P ₀ summation CT	<u>4.0 VA</u>
Interim result	14.0 VA

The individual transformer must provide its VA share from this 14.0 VA corresponding to its ratio to the “total transmission”.

Consideration must also be given to the respective power loss between the main transformer and the summation transformer plus other possible losses.

1. Main transformer 1000 / 5A	$\frac{1000}{2400} \times 14.0 = 5.83 \text{ VA} + \text{additional possible losses}$
2. Main transformer 800 / 5A	$\frac{800}{2400} \times 14.0 = 4.67 \text{ VA} + \text{additional possible losses}$
3. Main transformer 600 / 5A	$\frac{600}{2400} \times 14.0 = 3.50 \text{ VA} + \text{additional possible losses}$

The VA values of the main transformers are to be rounded up to the corresponding VA values in our charts.

The ratio of the primary current of a main transformer to the sum of the primary currents of all main current transformers the ratio must not exceed 1:8.

Important indication to the power measuring

Too many rising deviation can prevent the measuring transformer acting as a current transformer from fulfilling its protective function with regard to the connected measuring units, as in normal operation its functions is well below its saturation limit, and in the event of over currents, the saturation limit is reached considerably later and takes the function almost as a protection current transformer.

If there is too much of a decrease, the measuring transformer, as a result of the continuous excess demands will reach the saturation limit too soon and indirectly function as a switch, rendering a measuring impossible.

MPR 4	Multifunctional power meter 96 x 96 mm		Page: 88

Innovative connection technology to plug three single-phase current transformers to multifunctional power measuring unit

„QUICK CONNECT“

- Quick - simple - efficient - Safe and reliable -

Your advantages when choosing „Quick Connect“

- Considerable reduction of working time because of less wiring and installation work
- Vast saving of labour costs through faster wiring
- Elimination of connection errors due to simple „Plug 'n Play“ technology
- Increased safety and less downtime due to integrated protection circuit, which allows to connect the three single-phase current transformers even when the grid is energized
- Large current range from 60 – 1250 A with only three different types of current transformer
- Two multifunctional power measuring units (72x72 mm & 96x96 mm) to select

„Quick Connect“ – the modular power meter system of MBS

How it works:

1. Choose current transformer (three construction types, selectable from 60 A up to 1250 A)
2. Define the needed measuring unit (MPR 3 in size 72x72 mm or MPR 4 in size 96x96 mm)
3. Pick the required cable length (0.3 m – max. 5.0 m; standard: 1 m)
4. Send all information to MBS – and you're done!

You have never set the components for a multifunctional power meter system faster.

Three single-phase current transformers „ASKDS“ with innovative connection technology „Quick Connect“

ASKDS 25

Quick – simple – efficient

- Quicker installation than with three conventional current transformers
- Simpler wiring by 8-pin RJ45-connector, instead of 6 individual wires when using conventional current transformers
- Most efficient set-up of a multifunction power measurement combined with our multifunctional power measuring unit MPR 3 (72x72 mm) or MPR 4 (96x96 mm)

Features / benefits

- Three single-phase current-transformer-set designed for the usage together with our multifunctional power measuring units MPR 3 (72x72 mm) or MPR 4 (96x96 mm)
- Transmission of the measuring signal to the measuring unit using a modified RJ45 bus via a standard-CAT5-patch cable (deliverable in different lengths, max. 5m)
- All current transformers can be operated permanently open, due to a built-in protection circuit
- Three single-phase current transformer-set developed for installation directly

ASKDS 33

General technical specifications

- Operating temperature: $-10^{\circ}\text{C} < T < +50^{\circ}\text{C}$
- Storage temperature: $-25^{\circ}\text{C} < T < +70^{\circ}\text{C}$
- Therm. nominal continuous rated current I_{cth} : $1.0 \times I_N$
- Therm. nominal short-time current I_{th} : $60 \times I_N$, 1 sec.
- Max. operating voltage U_m : 1.2 kV
- Isolation test voltage: 6 kV, U_{eff} , 50 Hz, 1 min.
- Output limit under overload: $\leq 2 \times U_{AN}$
- Rated frequency: 50 Hz
- Isolation class: B
- Applicable technical standard: IEC 61869, part 8 in the region of standard circuit breakers

Multifunctional power measuring unit „MPR 3“ with innovative connection technology „Quick Connect“

Features / benefits

- Simpler wiring of the three single-phase current-transformer-set ASKDS via 330 mV voltage output for equivalent primary current from 60 A to 1250 A
- Alternatively the split-core current transformers type KBR 18/32/44 can be connected by means of a RJ45-adaptor
- Replaces a variety of analogue measuring devices, along with significantly less wiring expenses
- Storage of minimum and maximum values allows monitoring and error analysis
- Due to a digital in- and output as well as a pulse output a connection to a power management system is possible
- Additionally the device has a Modbus-RTU interface (RS485)

Application

Energy is becoming more and more expensive and is thus a steadily growing cost factor.

In order to detect high-level power consumers, MBS AG has developed the multifunctional measuring unit MPR 3 (72x72 mm) and MPR 4 (96x96 mm) in combination with the three single-phase current-transformer-set ASKDS, which are especially designed for monitoring of 3- or 4-line networks in building technology.

All relevant network data can be measured and displayed

Measurements

The following measurements can be displayed with the multifunctional measuring unit MPR 3:

- The current values for voltage, current, frequency and power factor
 - The active power, apparent power and reactive power for each phase and for the whole grid
 - The minimum and maximum values for voltage, current, active power, reactive power and power factor for each phase and for the whole grid
- Optionally the THD-I and THD-V can be displayed.

Additionally integrated into the device is a 4-quadrant energy meter for the active and reactive energy, two operating hours counters and a rotary field direction display. One of the operating hours counter can be reset manually.

The device is operated by using four buttons and the menu on the display.

All the outputs given above are galvanically isolated from the measurement inputs and the auxiliary voltage.

Technical parameters**Input**

Input voltage	10-400 V AC L-N (10-690 V AC (L-L) (2.5 mm ²)
Input current (U ~ I):	0 – 330 (500) mV via current-transformer-set ASKDS using CAT5 RJ45-cable (alternatively via split-core current transformer type KBR 18/32/44 by means of RJ45-adaptor)
Frequency:	45-65 Hz
Auxiliary supply:	185 – 300 V AC/DC $\pm$ 10 % (2,5 mm ²)
Power consumption:	< 5 VA

Housing according to DIN / IEC 61 554 (DIN 43 700)

Dimensions (W x H x D) / Cut-out:	72 x 72 x 50 mm / 68 ^{+0.7 / -0.0} x 68 ^{+0.7 / -0.0} mm
Weight:	Approx. 230 g
Mounting:	Snap-on mounting for instrument panel thickness $\leq$ 8 mm
Terminals:	Voltage: Screw terminals Current: 8-pin RJ45-connector
Front panel:	4 control keys
Display:	FSTN LCD-Display with background illumination
Display dimensions (W x H):	2.6"

Environment behaviour

Operating temperature:	- 10 °C ... + 55 °C
Storage temperature:	- 20 °C ... + 70 °C
Relative humidity:	Up to 90%, non-condensing
Sea level:	Up to 2000 m
Pollution degree:	2, according to EN 61010-1:2011

Operation conditions

Electrical safety:	According to EN 61010-1:2011; CAT III 300 V
Protection class according to EN 60529:	IP51 Front panel; IP20 Terminals
Max. voltage to earth:	$\leq$ 400 V

EMC

Emission:	According to EN 55011 Class A; EN 55022 Class B
Susceptibility:	According to EN 61000-4-2, EN 61000-4-3, EN 61000-4-4

Measuring accuracy

Current, voltage,	0,5 %
Active-, reactive-, apparent power, active energy	1,0 %
Reactive energy	2,0 %
cos φ	0,2 %
Frequency	0,1 %

Output modules

Pulse output:	Max. 1 pulse output possible
Impulse time:	20, 40, 60, 80, 100, 150, 200, 300, 400, 500 ms
Switch current (pulse output):	Max. 50 mA
Extern voltage (pulse output):	5 ... 48 V
RS485 Modbus-RTU	Max. 1 Modbus module possible (max. $\pm$ 12 V, 1,5 mm ²)
Baud rate (Modbus):	2400, 4800, 9600, 19200, 38400, 57600, 115200
Address / Parity (Modbus):	1 – 247 / Even, Odd, None
Max. communication range (Modbus):	1200 m (by using repeater)
Digital in- / output	1 Input + 1 Output (5 – 30 V DC, 1,5 mm ²)

Memory

Internal memory	1 MB

Multifunctional power measuring unit „MPR 4“ with innovative connection technology „Quick Connect“

Features / benefits

- Simpler wiring of the three single-phase current-transformer-set ASKDS via 330 mV voltage output for equivalent primary current from 60 A to 1250 A
- Alternatively the split-core current transformers type KBR 18/32/44 can be connected using the screw terminals of the measuring device
- Replaces a variety of analogue measuring devices, along with significantly less wiring expenses
- Storage of minimum and maximum values allows monitoring and error analysis
- Due to an integrated Modbus-RTU interface (RS485) a connection to a power management system is possible
- Optionally the device can be equipped with an output module, which has the following outputs: 2x digital input; 2x digital output; 2x analogue output; 2x switching output

Application

Energy is becoming more and more expensive and is thus a steadily growing cost factor. In order to detect high-level power consumers, MBS AG has developed the multifunctional measuring unit MPR 3 (72x72 mm) and MPR 4 (96x96 mm) in combination with the three single-phase current-transformer-set ASKDS, which are especially designed for monitoring of 3- or 4-line networks in building technology. All relevant network data can be measured and displayed.

Measurements

The following measurements can be displayed with the multifunctional measuring unit MPR 4:

- The current values for voltage, current, frequency and power factor
 - The active power, apparent power and reactive power for each phase and for the whole grid
 - The minimum and maximum values for voltage, current, active power, reactive power and power factor for each phase and for the whole grid
- Optionally the THD-I and THD-V can be displayed.

Additionally integrated into the device is a 4-quadrant energy meter for the real and reactive energy, two operating hours counters and a rotary field direction display. One of the operating hours counter can be reset manually.

The device is operated by using five buttons and the menu on the display.

All the outputs given above are galvanically isolated from the measurement inputs and the auxiliary voltage.

Order list

Art.-No.	RS485 (Modbus RTU)	Available output modules	Alarm	Event logs	Outage records	THD-I	THD-U
99-96003	.	Digital in-/output, Relay output, Analogue output, Pulse output	.	.	.	.	.

Technical parameters**Input**

Input voltage	5-277 V AC L-N (5-480 V AC (L-L) (2.5 mm ²))
Input current (U ~ I):	0 – 330 (500) mV via current-transformer-set ASKDS using CAT5 RJ45-cable (alternatively via split-core current transformer type KBR 18/32/44 by means of RJ45-adaptor))
Frequency:	50-60 Hz
Auxiliary supply:	50 - 270 V AC/DC $\pm$ 10 % (2,5 mm ²)
Power consumption:	< 5 VA

Housing

Dimensions (W x H x D) / Cut-out:	96 x 96 x 46 mm / 92 ^{+0.7 / -0.0} x 92 ^{+0.7 / -0.0} mm
Weight:	Approx. 340 g
Mounting:	Snap-on mounting for instrument panel thickness $\leq$ 8 mm
Terminals:	Voltage: Screw terminals Current: 8-pin RJ45-connector
Front panel:	5 control keys
Display:	FSTN LCD-Display with background illumination
Display dimensions (W x H):	3.5"

Environment behaviour

Operating temperature:	- 5 °C ... + 55 °C
Storage temperature:	- 20 °C ... + 70 °C
Relative humidity:	Up to 90%, non-condensing
Sea level:	Up to 2000 m
Pollution degree:	2, according to EN 61010-1:2011

Operation conditions

Electrical safety:	According to EN 61010-1:2011; CAT III 300 V
Protection class according to EN 60529:	IP51 Front panel; IP20 Terminals
